

Restoration and Floodplain Reconnection on Georges Creek

Civil & Environmental
Consultants, Inc.

ALLEGANY COUNTY
DEPARTMENT OF ECONOMIC
& COMMUNITY DEVELOPMENT

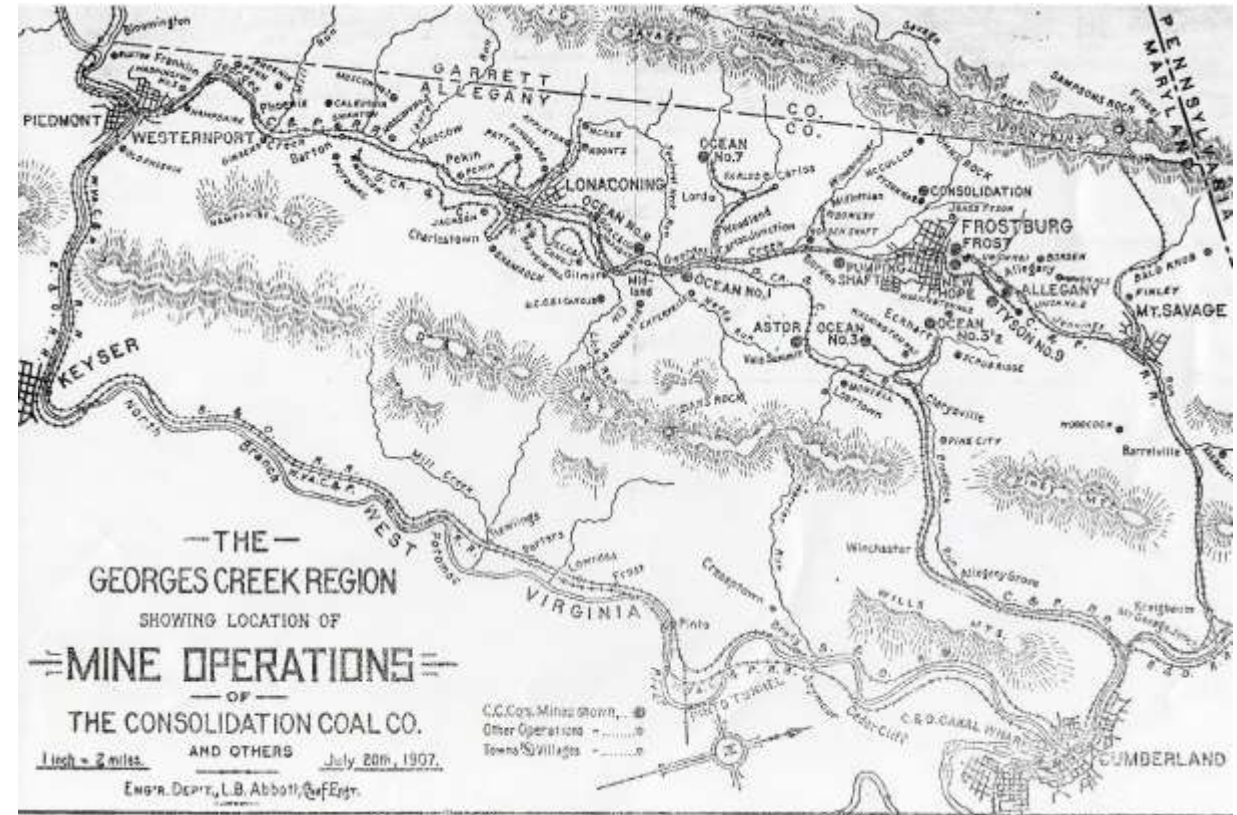

Presented By:
Jeff Shaver and
Patrick McMahon

2022 National Stream Restoration Conference, Nashville, TN

Site Location and History

- Allegany County, Maryland
- Georges Creek Coal and Iron Company- 1837
- Mining Peaked in the early 1900s
- Employed 5,000 people in watershed in 1910
- Employment dropped to 500 by 1950
- The abandoned mines left destabilized streams and chronic erosion and sediment problems

Project Goals

- Funded by Maryland Abandoned Mine Lands Section and Chesapeake and Atlantic Coastal Bay Trust.
- Goals:
- Fill and seal two abandoned surface mine pits
- Reclaim two highwalls
- Relocate and Restore 3,500 feet of stream
- Improve wetland and floodplain connectivity
- Improve existing stream crossing
- Create a public use recreation pond

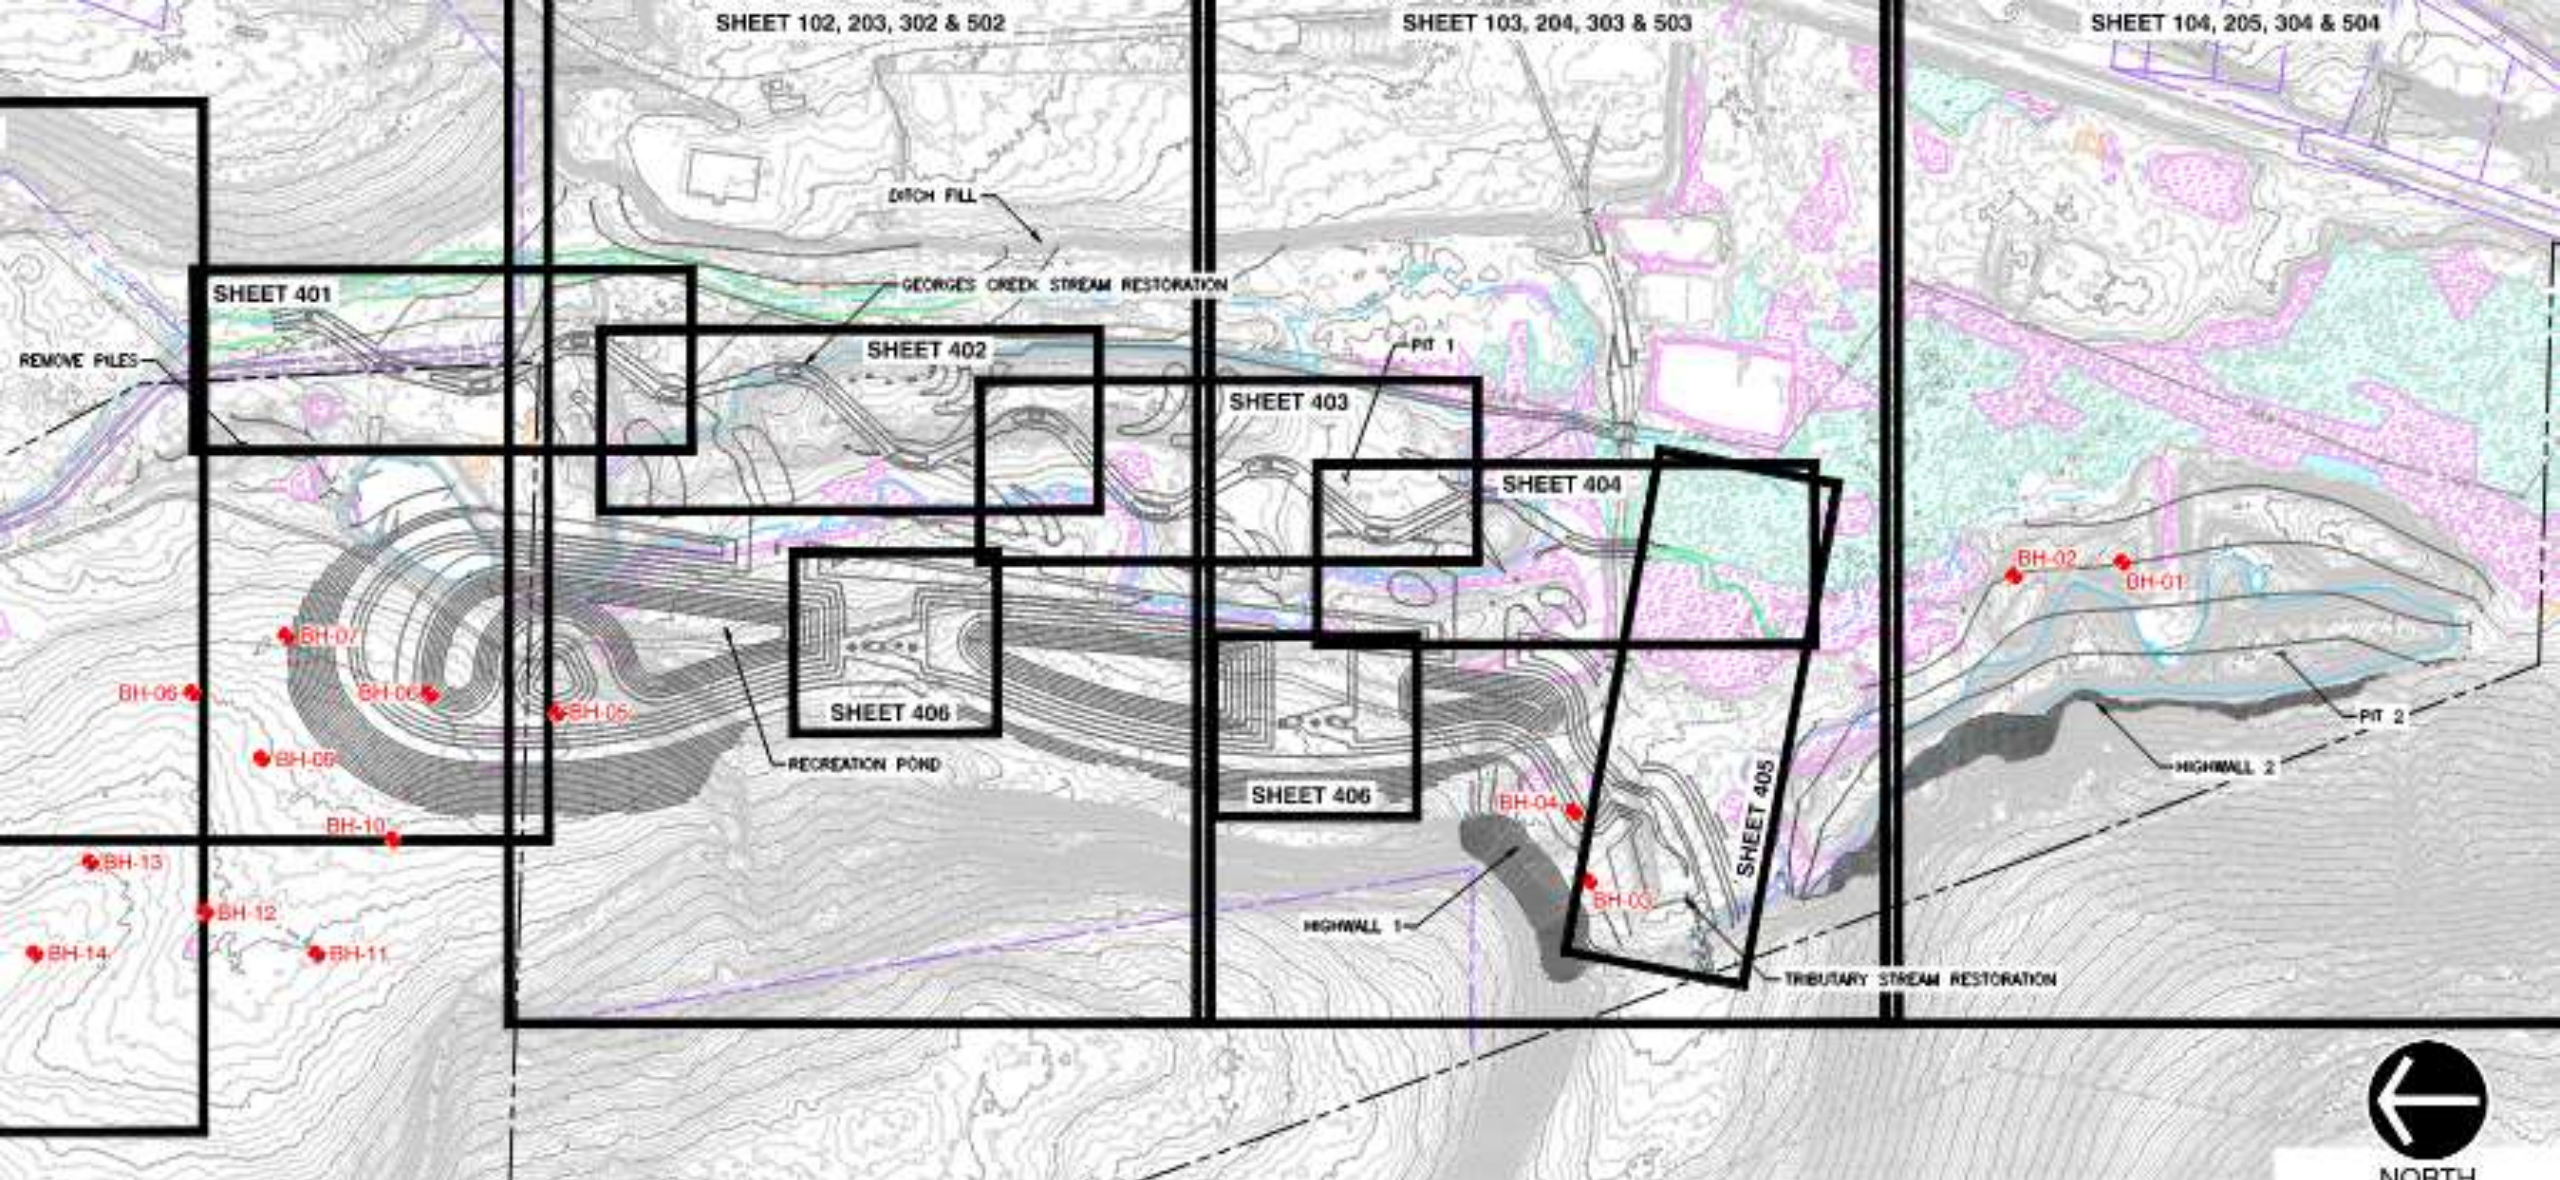

Scope of Services

- Geotechnical Investigation
- Hydrogeology and Water Quality Analysis
- Geomorphic Survey
- Stream and Wetland Delineations
- Survey
- Permitting
- Grading Plan and Specs
- Stream Restoration Design Plans and Specs

SITE AERIAL OVERVIEW WITH DESIGN CONTOURS

PROJECT OVERVIEW AND SHEET LAYOUT

Selected Highlights

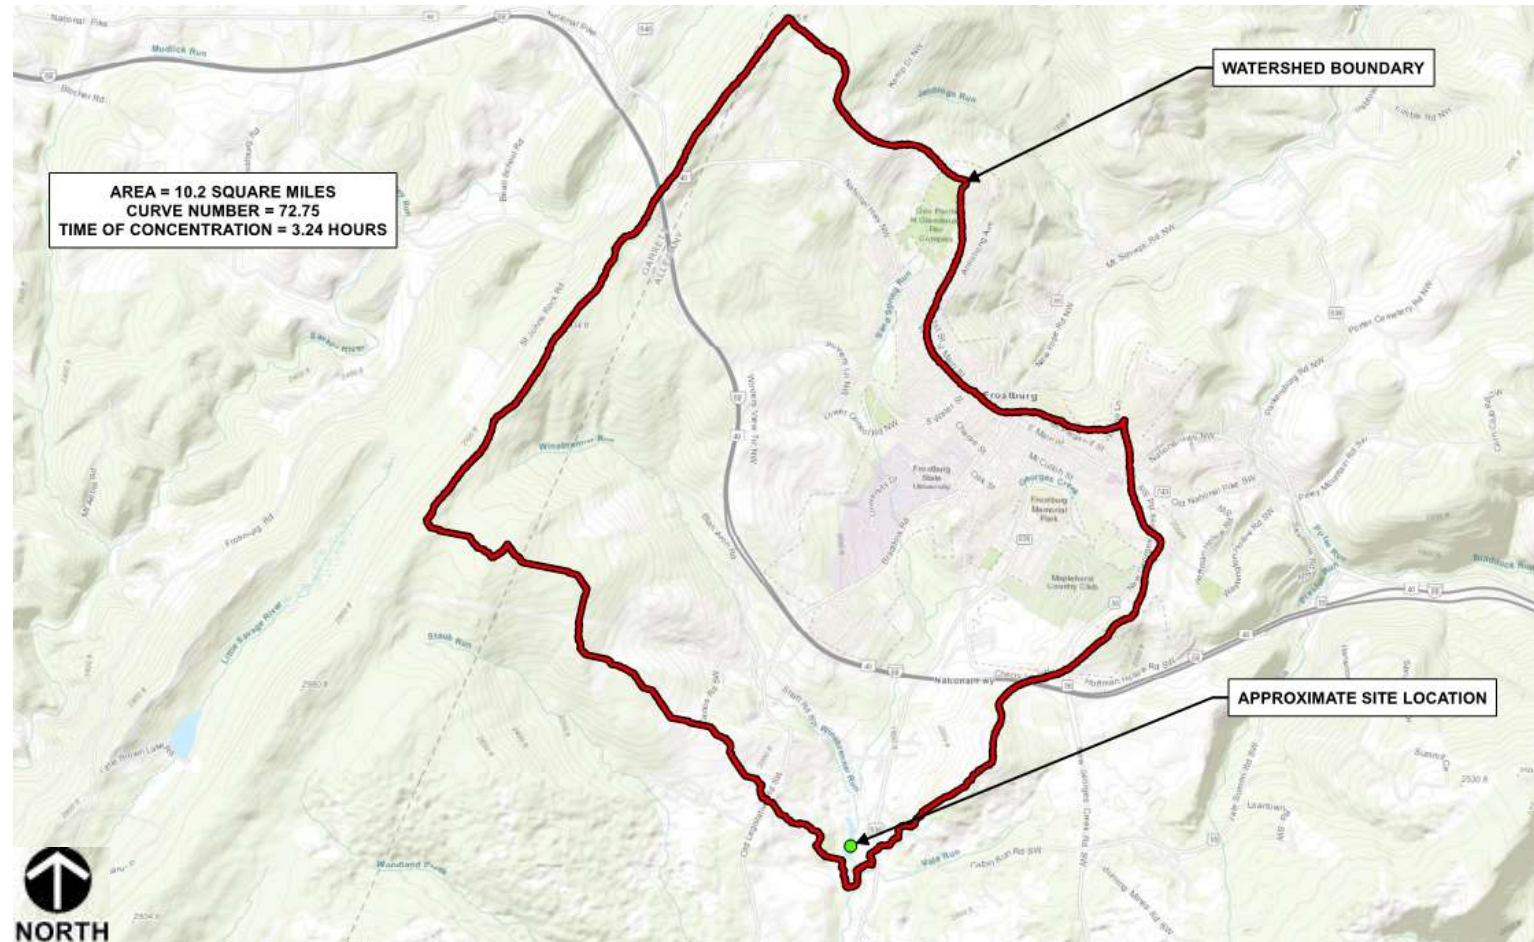

- Floodplain Reconnection
 - Integration of anastomosing channels and wetland complexes
- Application of 2D modeling
 - Proof of Concept / Concept evaluation

Floodplain Reconnection / 2D Modeling

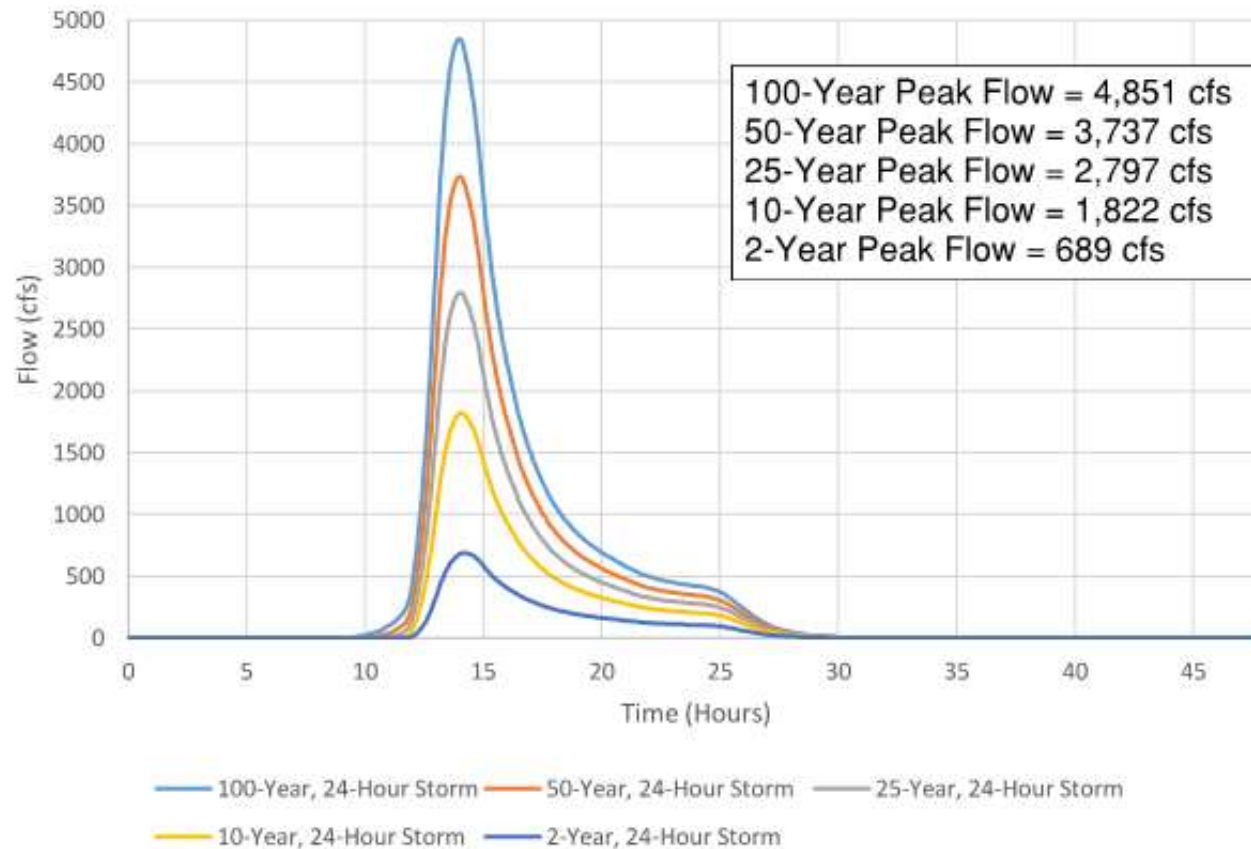

Hydrologic Analysis

- USACE HEC-HMS
 - Simulate the precipitation-runoff process
- Watershed Characteristics
 - Drainage Area = 10.2 mi²
 - Composite Curve Number = 73
 - Time of Concentration = 3.24 hrs
 - Rainfall depth

Floodplain Reconnection / 2D Modeling

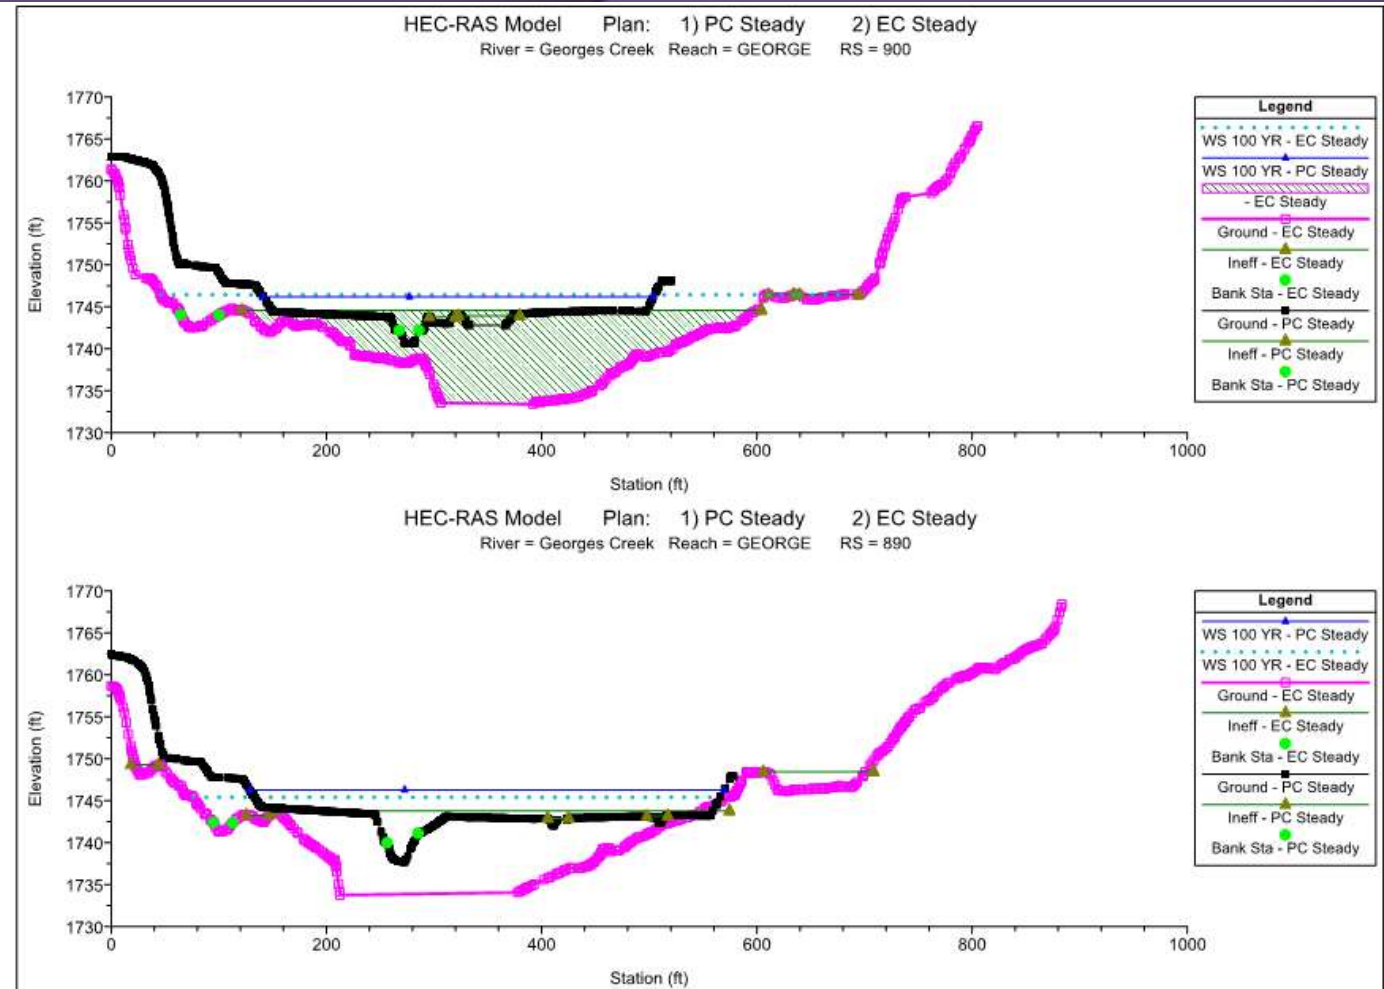

HEC-HMS Results
Runoff Hydrographs

Floodplain Reconnection / 2D Modeling

Hydraulic Analysis

- USACE HEC-RAS
 - Simulate the precipitation-runoff process
- Storm Events
 - 2-, 10-, 25-, 50-, and 100-Year
- Geometry
 - LiDAR - FEMA Region 3 FY12 for Allegany County, Maryland
 - Supplemental topographic information obtained in 2018

Floodplain Reconnection / 2D Modeling

← EC vs PC Comparison

PC vs SFHA Comparison →

Modeled Shear Stress for 2-Year Flood

PC 2yr Shear Stress (lb/ft²)

Floodplain Reconnection / 2D Modeling

- Potential modeling pitfalls
 - Model is not Purpose-Driven
 - Scale and Resolution
 - Relative vs Absolute Results
 - Understand the limits and assumptions
 - Steady, Gradually Varied flow?
 - Full momentum or Dynamic Wave – eddy formation
 - Slope
 - Courant Condition

Summary

- Overbank flooding design recurrence interval ~1.0 years
 - 1.78 in rainfall in 24 hours
- Encourage the recruitment of wetlands and anastomosed (braided) streams across the floodplain
- Proposed bankfull channel contains the required shear stress and stream power to competently balance the bedload, suspended loads, and wash loads to maintain a functional stream and riparian corridor
- Ponds have been designed to the west of the Georges Creek alignment to provide recreational fishing opportunity for the community.
 - Recharged by overbank flows coming out of Georges Creek and unnamed tributary
